Experience

Airtel Payments Bank

07/2023 - Present

Software Engineer

Gurugram, India

Project 1: Sound Box Allocation

Objective: To establish a systematic, hierarchical process for the efficient allocation, distribution and return of soundbox between the vendor and the market.

Key Contribution

- Handled the icon for **Device Allocation and tracking** on Ranger App.
- Spearheaded the development of a solution to streamline the allocation and tracking of **2.5 million SoundBox Devices**, addressing challenges associated with multilevel distribution and reverse allocation.
- Used **SpringBoot** framework for rapid development and seamless integration and utilized **RESTful APIs** for communication between different components of the system, ensuring interoperability and flexibility.
- Build **RESTful API** to fetch the details of user for a particular device and also number of devices allocated to a particular user. Another API to fetch the return devices for a particular user.
- Used **KONG** for managing API's and routing requests to the upstream server.
- Employed a database system or storing and managing data related to products and user details.
- Worked on the both the forward flow and reverse flow for allocation and returning of the device.

Project 2: Gamification Platform

Objective: Developed a gamification system to track and reward points to field rangers based on daily activities, enhancing engagement and productivity.

Key Contribution

- Real-time Event Capture:** Integrated **Kafka** for event streaming, capturing ranger activity like **login, start my day** and **market visits** from app-services microservice.
- Configurable Activity Tracking:** Designed a configurable system on the receiver end (KPI-SERVICE) to allow flexibility in tracked activity.
- Efficient Data Handling:** Implemented a database and caching mechanism for storing and rapidly accessing user activity data, ensuring quick and reliable data availability for leaderboard and rewards calculation.

Project 3: OTP Based Check-in

Objective: Built a location and inactivity tracking system to monitor field ranger status and ensure accurate availability logging.

Key Contribution

- Automated Inactivity Tracking:** Created an automated system to log out inactive ranger, with inactivity thresholds configurable at 15 minutes.
- Geolocation-Based Monitoring:** Implemented a geo-fencing system to log out rangers who move more than 1 Km from designated metro station.
- Enhanced Reliability:** Increased operational efficiency by implementing automated tracking, which significantly reduced instances of inaccurate availability and supported real-time workforce management.

Skills

Languages And Framework: C++, Java, Springboot, JPA, Solidity

Backend Technologies and Tools: Kafka, Elastic Search, Nginx, Kong, Grafana, Kibana, Jenkins, SonarQube

Database: Oracle, Aerospike, SQL

Web 3.0: Blockchain, Smart Contract, Ethereum

Relevant Coursework: Operating Systems, Database Management Systems, Algorithm Design and Analysis, Object Oriented Design, Data Structures, Computer Networks

Education

Delhi Technological University

CGPA: 7.92/10

Bachelor of Technology in Software Engineering

08/2019 - 09/2023

Project

Krypto App | Web 3.0, Ethereum, BlockChain, MetaMask, Solidity, Smart Contracts

- Built a modern real **Blockchain application**
- The application used to send **Ethereum** through **Blockchain**.
